GENERAL INFORMATION

Product Description for Equipment under Test (EUT)

The BTECH (BAOFENG TECH)'s product, model: UV-50X3 (FCC ID: 2AGNDUV50X3) (the "EUT") in this report is a Mobile Radio, which was measured approximately: 16.0 cm (L) x 13.5 cm (W) x 4.5 cm (H), rated input voltage: DC13.8V from battery.

Report No.: RXM160406050-00

* All measurement and test data in this report was gathered from production sample serial number: 160406050. The EUT was received on 2016-04-08.

Objective

This test report is prepared on behalf of *BTECH* (*BAOFENG TECH*) in accordance with Part 2, Part 90 of the Federal Communications Commission rules.

Related Submittal(s)/Grant(s)

No related submittal(s).

Test Methodology

All tests and measurements indicated in this document were performed in accordance with the Code of federal Regulations Title 47 Part 2, Sub-part J as well as the following individual parts:

Part 90 - Private Land Mobile Radio Service

Applicable Standards: TIA-603-D.

All emissions measurement was performed and Bay Area Compliant Laboratories Corp. (Dongguan). The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

Test Facility

The Test site used by Bay Area Compliant Laboratories Corp. (Dongguan) to collect test data is located on the No.69 Pulongcun, Puxinhu Industrial Zone, Tangxia, Dongguan, Guangdong, China

Test site at Bay Area Compliant Laboratories Corp. (Dongguan) has been fully described in reports submitted to the Federal Communication Commission (FCC). The details of these reports have been found to be in Compliant with the requirements of Section 2.948 of the FCC Rules on February 06, 2015.

The Federal Communications Commission has the reports on file and is listed under FCC Registration No.: 273710. The test site has been approved by the FCC for public use and is listed in the FCC Public Access Link (PAL) database.

FCC Part 90 Page 4 of 49

SYSTEM TEST CONFIGURATION

Description of Test Configuration

The system was configured for testing in a test mode.

EUT Specification:

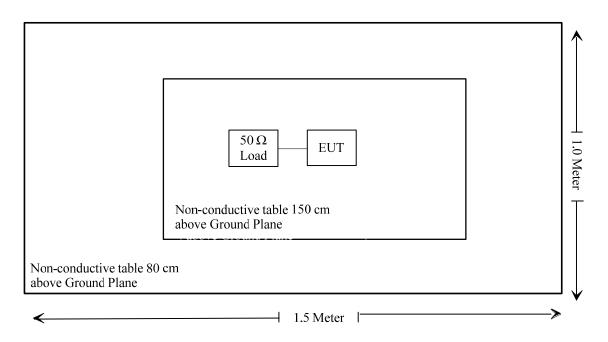

| Frequency Band | VHF: 136-174 MHz UHF: 400-480MHz |
|-----------------------------|---|
| Modulation Mode | FM |
| Channel Spacing | 6.25 kHz ,12.5kHz |
| 12.5 kHz Rated Output Power | VHF&UHF: High: 50W, Middle:20W, Low: 5W |
| 6.25 kHz Rated Output Power | VHF&UHF: 1W |

Report No.: RXM160406050-00

Support Equipment List and Details

| Manufacturer | Description | Model | Serial Number |
|--------------|-----------------|-------|---------------|
| / | 50 Load Teminal | 100W | / |

Block Diagram of Test Setup

FCC Part 90 Page 5 of 49

SUMMARY OF TEST RESULTS

| FCC Rules | Description of Test | Results |
|--------------------------------|---------------------------------------|------------|
| FCC§1.1310 & §2.1091 | Maximum Permissible Exposure (MPE) | Compliance |
| §2.1046;§90.205 | RF Output Power | Compliant |
| §2.1047;§90.207 | Modulation Characteristic | Compliant |
| \$2.1049;\$90.209; \$90.210 | Occupied Bandwidth & Emission Mask | Compliant |
| §2.1051;§90.210 | Spurious Emission at Antenna Terminal | Compliant |
| §2.1053;§90.210 | Spurious Radiated Emissions | Compliant |
| §2.1055; §90.213 | Frequency Stability | Compliant |
| §90.214 | Transient Frequency Behavior | Compliant |

Report No.: RXM160406050-00

FCC Part 90 Page 6 of 49

FCC §2.1091- MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Applicable Standard

According to 1.1307 (b)(1), 2.1091 systems operating under the provisions of this section shall be operated in a manner that ensures the public is not exposed to RF energy level in excess of the communication guidelines.

Report No.: RXM160406050-00

Limits for Maximum Permissible Exposure (MPE)

| Limits for Occupational/Controlled Exposure | | | | | |
|---|--------------------------------------|--------------------------------------|-------------------------------|--|--|
| Frequency Range (MHz) | Electric Field Strength (E) (V/m) | Magnetic Field Strength (H) (A/m) | Power Density (S) (mW/cm²) | Averaging Time E , H or S (minutes) | |
| 0.3-3.0 | 614 | 1.63 | (100)* | 6 | |
| 3.0 - 30 | 1842/f | 4.89/f | $(900/f^2)*$ | 6 | |
| 30-300 | 61.4 | 0.163 | 1.0 | 6 | |
| 300-1500 | / | / | f/300 | 6 | |
| 1500-100,000 | / | / | 5 | 6 | |

f = frequency in MHz;

MPE Calculation

Predication of MPE limit at a given distance

 $S = PG/4\pi R^2$

Where: S = power density (in appropriate units, e.g. mW/cm^2); P = power input to the antenna (in appropriate units, e.g., <math>mW); G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm);

FCC Part 90 Page 7 of 49

^{* =} Plane-wave equivalent power density;

MPE Results

The device support VHF and UHF, the highest Power is 50+/-1W for UHF band, and 50+/-1W for VHF band:

Report No.: RXM160406050-00

| Frequency Bands | Antenna Gain | | Max. Conducted Output Power | Output Power* 50% duty cycle (PTT) | P*G | $S_{ m limit}$ |
|-----------------|--------------|-----------|--------------------------------------|--|-------|----------------|
| | (dBi) | (numeric) | (W) | (W) | (mW) | (mW/cm^2) |
| VHF(136-174MHz) | 3.5 | 2.24 | 51 | 25.5 | 57087 | 1.0 |
| UHF(400-480MHz) | 3.5 | 2.24 | 51 | 25.5 | 57087 | 1.33 |

$$S = PG/4\pi R^2$$

$$=>R^2=PG/(S*4\pi)$$

 $=>R^2$ should more than $PG/(S_{limit}*4\pi)$

For VHF:

$$R_{VHF} > [57087/(1 \times 4 \times 3.14)]^{0.5} = 67.4 \text{ cm}$$

For UHF:

$$R_{UHF} > [57087/(1.33 \text{ x 4 x } 3.14)]^{0.5} = 58.4 \text{ cm}$$

Result: Compliance, The device meets MPE requirement for Occupational/Controlled use at 70 cm distance(> 67.4cm).

FCC Part 90 Page 8 of 49

FCC §2.1046 & §90.205- RF OUTPUT POWER

Applicable Standard

FCC §2.1046 and §90.205.

Test Procedure

Conducted RF Output Power:

TIA-603-D section 2.2.1

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

Report No.: RXM160406050-00

| | | 479.9875 | 1.03 | / | / | / |

Report No.: RXM160406050-00

Note: the rated power is 1W for 6.25kHz, 50W for 12.5kHz high power level, 20W for 12.5kHz Middle Power level, 5W for 12.5kHz Low Power level.

FCC Part 90 Page 10 of 49

FCC §2.1047 & §90.207 - MODULATION CHARACTERISTIC

Applicable Standard

FCC§2.1047 & §90.207:

(a) Equipment which utilizes voice modulated communication shall show the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz. for equipment which is required to have a low pass filter, the frequency response of the filter, or all of the circuitry installed between the modulation limited and the modulated stage shall be supplied.

Report No.: RXM160406050-00

(b) Equipment which employs modulation limiting, a curve showing the percentage of modulation versus the modulation input voltage shall be supplied.

Test Procedure

Test Method: TIA/EIA-603 2.2.3

Test Equipment List and Details

Emission Mask D—12.5 kHz channel bandwidth equipment. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

- (1) On any frequency from the center of the authorized bandwidth f0 to 5.625 kHz removed from f0: Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least 7.27(fd-2.88 kHz) dB.
- (3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 12.5 kHz: At least $50 + 10 \log (P) \text{ dB}$ or 70 dB, whichever is the lesser attenuation.
- (4) The reference level for showing Compliant with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show Compliant with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained.

FCC Part 90 Page 21 of 49

(e) Emission Mask E—6.25 kHz or less channel bandwidth equipment. For transmitters designed to operate with a 6.25 kHz or less bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

Report No.: RXM160406050-00

- (1) On any frequency from the center of the authorized bandwidth fo to 3.0 kHz removed from fo: Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 3.0 kHz but no more than 4.6 kHz: At least 30 + 16.67(f_d-3 kHz) or 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation
- (3) On any frequency removed from the center of the authorized bandwidth by more than 4.6 kHz: At least 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation.
- (4) The reference level for showing compliance with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show compliance with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained.

FCC §2.1051& §90.210 - SPURIOUS EMISSIONS AT ANTENNA TERMINALS

Applicable Standard

Emission Mask D—12.5 kHz channel bandwidth equipment. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

(1) On any frequency from the center of the authorized bandwidth f0 to 5.625 kHz removed from f0: Zero dB.

Report No.: RXM160406050-00

- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least 7.27(fd-2.88 kHz) dB.
- (3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 12.5 kHz: At least $50 + 10 \log (P) \text{ dB}$ or 70 dB, whichever is the lesser attenuation.
- (4) The reference level for showing Compliant with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show Compliant with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained.

Emission Mask E—6.25 kHz or less channel bandwidth equipment. For transmitters designed to operate with a 6.25 kHz or less bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

- (1) On any frequency from the center of the authorized bandwidth f_0 to 3.0 kHz removed from f0: Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 3.0 kHz but no more than 4.6 kHz: At least 30 + 16.67(fd-3 kHz) or 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation.
- (3) On any frequency removed from the center of the authorized bandwidth by more than 4.6 kHz: At least 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation.
- (4) The reference level for showing compliance with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show compliance with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained

Report No.: RXM160406050-00

Test Procedure

Adjust the spectrum analyzer for the following settings:

- 1) Resolution Bandwidth = 100 kHz for spurious emissions below 1 GHz, and 1 MHz for spurious emissions above 1 GHz.
- 2) Video Bandwidth \geq 3 times the resolution bandwidth.
- 3) Sweep Speed ≤ 2000 Hz per second.
- 4) Detector Mode = mean or average power.

Test Data

Environmental Conditions

| Temperature: | 26.5~28.4 °C |
|--------------------|---------------|
| Relative Humidity: | 50~58 % |
| ATM Pressure: | 100.5~100.6Pa |

The testing was performed by Dean Liu on 2016-04-15 &2016-05-18.

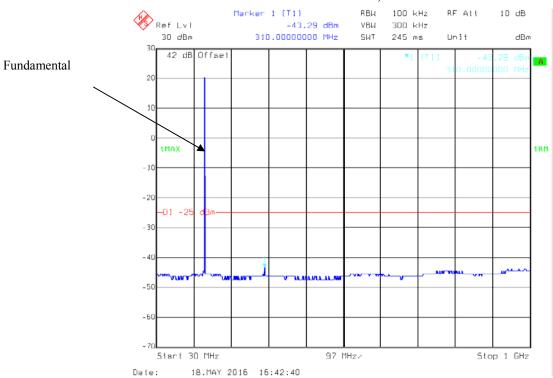

Note: For conducted spurious emissions were tested at high rated power, which was the worst case.

^{*} Statement of Traceability: Bay Area Compliant Laboratories Corp. (Dongguan) attests that all calibrations have been performed, traceable to National Primary Standards and International System of Units (SI).

Test Procedure

The transmitter was placed on a wooden turntable, and it was transmitting into a non-radiating load, which was also placed on the turntable.

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.

The frequency range up to tenth harmonic of the fundamental frequency was investigated.

Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

For part 90:

Spurious emissions in dB = $10 \log_{10}$ (TXpwr in Watts/0.001)-the absolute level

FCC Part 90 Page 38 of 49

Spurious attenuation limit in dB = $50+10 \text{ Log}_{10}$ (power out in Watts) for EUT with a 12.5 kHz channel bandwidth.

Report No.: RXM160406050-00

Spurious attenuation limit in dB = $55+10 \text{ Log}_{10}$ (power out in Watts) for EUT with a 6.25 kHz channel bandwidth.

Test Data

Note1: For radiated spurious emissions were tested at high rated power, which was the worst case.

Note2: The unit of Antenna Gain is dBd for frequency below 1GHz, and the unit of Antenna Gain is dBi for frequency above 1GHz.

Note3: Absolute Level = SG Level - Cable loss + Antenna Gain

Margin = Limit-Absolute Level

Report No.: RXM160406050-00

Test Procedure

Frequency Stability vs. Temperature: The equipment under test was connected to DC power supply and the RF output was connected to a frequency counter via feed-through attenuators. The EUT was placed inside the temperature chamber. The power leads and RF output cable exited the chamber through an opening made for the purpose.

After the temperature stabilized for approximately 20 minutes, the frequency output was recorded from the counter.

The frequency stability shall be measured with variation of primary supply voltage as follows:

(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

Test Data

Environmental Conditions

| Temperature: | 25.1 °C |
|--------------------|-----------|
| Relative Humidity: | 55 % |
| ATM Pressure: | 100.9 kPa |

The testing was performed by Dean Liu on 2016-04-17.

Report No.: RXM160406050-00

Test Procedure

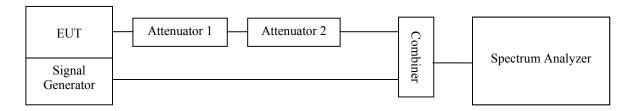

- a) Connect the EUT and test equipment as shown on the following block diagram.
- b) Set the Spectrum Analyzer to measure FM deviation, and tune the RF frequency to the transmitter assigned frequency.
- c) Set the signal generator to the assigned transmitter frequency and modulate it with a 1 kHz tone at ± 12.5 kHz deviation and set its output level to -100dBm.
- d) Turn on the transmitter.
- e) Supply sufficient attenuation via the RF attenuator to provide an input level to the Spectrum Analyzer that is 40 dB below the maximum allowed input power when the transmitter is operating at its rated power level. Note this power level on the Spectrum Analyzer as P₀.
- f) Turn off the transmitter.
- g) Adjust the RF level of the signal generator to provide RF power equal to P₀. This signal generator RF level shall be maintained throughout the rest of the measurement.
- h) Remove the attenuation 1, so the input power to the Spectrum Analyzer is increased by 30 dB when the transmitter is turned on.
- i) Adjust the vertical amplitude control of the spectrum analyzer to display the 1000~Hz at ± 4 divisions vertically centered on the display. Set trigger mode of the Spectrum Analyzer to "Video", and tune the "trigger level" on suitable level. Then set the "tiger offset" to -10ms for turn on and -15ms for turn off.
- j) Turn on the transmitter and the transient wave will be captured on the screen of Spectrum Analyzer. Observe the stored display. The instant when the 1 kHz test signal is completely suppressed is considered to be t_{on}. The trace should be maintained within the allowed divisions during the period t₁ and t₂.

FCC Part 90 Page 44 of 49

^{*} Statement of Traceability: Bay Area Compliant Laboratories Corp. (Dongguan) attests that all calibrations have been performed, traceable to National Primary Standards and International System of Units (SI).

k) Then turn off the transmitter, and another transient wave will be captured on the screen of Spectrum Analyzer. The trace should be maintained within the allowed divisions during the period t₃.

Report No.: RXM160406050-00

Test Data

Environmental Conditions

| Temperature: | 26.5~28.1 °C | |
|--------------------|-------------------|--|
| Relative Humidity: | 58~62 % | |
| ATM Pressure: | 100.5 ~ 100.8 kPa | |

The testing was performed by Dean Liu on 2016-04-15 and 2016-05-18.

For UHF Band:

| Channel Spacing (kHz) | Transient Period (ms) | Maximum frequency difference | Result |
|-----------------------|-----------------------|------------------------------|--------|
| | $10(t_1)$ | ±12.5 kHz | |
| 12.5 | 25(t ₂) | ±6.25 kHz | Pass |
| | $10(t_3)$ | ±12.5 kHz | |
| | $10(t_1)$ | ±6.25 kHz | |
| 6.25 | 25(t ₂) | ±3.125 kHz | Pass |
| | $10(t_3)$ | ±6.25 kHz | |

For VHF Band:

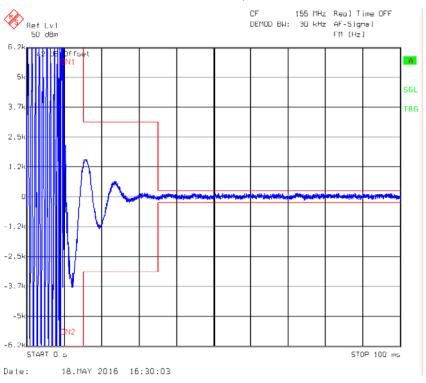

| Channel Spacing (kHz) | Transient Period (ms) | Maximum frequency difference | Result |
|-----------------------|--------------------------|------------------------------|--------|
| 12.5 | 5(t ₁) | ±12.5 kHz | Pass |
| | 20(t ₂) | $\pm 6.25 \mathrm{kHz}$ | |
| | 5(t ₃) | ±12.5 kHz | |
| 6.25 | 5(t ₁) | ±6.25 kHz | Pass |
| | 20(t ₂) | ±3.125 kHz | |
| | 5(t ₃) | ±6.25 kHz | |
